adaptability

**case study: Vanderbilt**

- Teknion designed and manufactured "technology pods" with embedded technology, creating multi touch capability
- For the first time we have designed and manufactured "panic doors" as well as barn doors with embedded mag locks
- Altos was used in the classrooms for its design function and flexibility - Optos was used in the offices for its sleek store front design
- Teknion worked closely with the architect and general contractors in order to match their vision and give every wall a purpose
- Vanderbilt has historically been a long time user of DIRTT, but through the relationship with the A&D we were able to "get a seat at the table"
